

■ HELIX READER — Executive Panel Presentation Pitch

Comprehensive Pitch Script • Kindle vs. Helix Comparison • Architectural Defense • Live Demo Flow

1. Executive Summary & 60-Second Panel Pitch

"Honorable members of the panel, today we are presenting **Helix Reader** — an open-web, AI-augmented digital library designed to liberate digital reading from closed ecosystems and static interfaces.

While over 158 million books have been digitized globally, traditional e-readers like Amazon Kindle lock users inside proprietary stores, lack real-time multi-sensory accessibility tools, and treat digital reading as a passive text dump. **Helix Reader solves this** by combining a 158-million-book discovery engine, real-time word-by-word TTS karaoke tracking, 28 custom aesthetic theme engines, embedded AI analysis, and a Cloud-synced vocabulary suite into a zero-install web application."

4. Panel Q&A; Defense Strategy

Q1: How does Helix Reader handle copyright and book sourcing?

Answer: Helix Reader respects copyright by functioning as an aggregator for public domain works and open-access digital repositories. For works outside the local 15,000-book catalog, the platform provides direct, authorized redirects to Project Gutenberg, Open Library, Google Books, and Archive.org.

Q2: How does the word-by-word voice highlight work under the hood?

Answer: We utilize the Web Speech API's SpeechSynthesisUtterance.onboundary event. Paragraph text tokens are wrapped in lightweight DOM spans with character offsets. As the browser's speech engine speaks each word, onboundary emits character indices in real-time, allowing our renderer to highlight the exact word span with zero latency.

Q3: How is user data synchronized and secured against duplicates?

Answer: We built a dual-indexed Cloud Firestore backend (users + emails collections). Whenever a user signs up or logs in via Google/GitHub OAuth or password, the system performs a zero-index direct document lookup on the normalized email address. This guarantees that duplicate accounts cannot be created under the same email across any browser, while preserving bookmarks and progress globally.
